Digital Images

- Image are 2D arrays of dimensions $M \times N$
- Each *pixel* (i, j) takes values in $\{0, 1, \ldots, 255\}$
- Image histogram gives the number of pixels that take a particular intensity $h[k]$ is the count of the pixels that take the intensity level k
- Normalised histogram $p[k] = \frac{1}{MN} h[k]$

Which has ‘Better’ Contrast?

(a) Image 1

(b) Image 2

Histogram Equalisation

Lemma

Let X be a continuous random variable with an invertible cumulative distribution function F_X, and let $Y = F_X(X)$. Then, $Y = \mathcal{U}[0, 1]$.

Proof.

Since $Y = F_X(X)$, $0 \leq Y \leq 1$.

$$\begin{aligned} \forall y \in [0, 1],\ F_Y(y) &= P[Y \leq y], \\ &= P[F_X(X) \leq y], \\ &= P[X \leq F_X^{-1}(y)], \\ &= F_X(F_X^{-1}(y)) = y. \end{aligned}$$

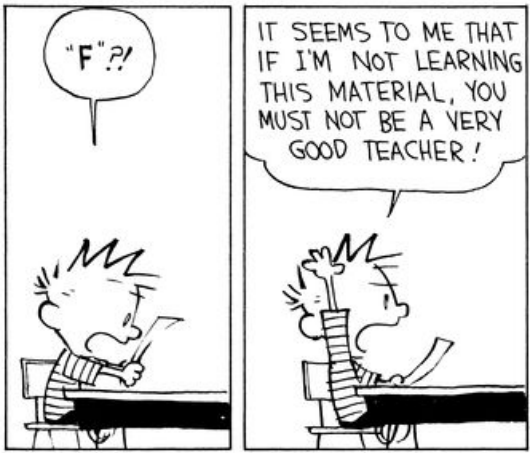
Therefore, $Y = \mathcal{U}[0, 1]$. □

Discrete Implementation of Histogram Equalisation

- Given image $I[i, j]$
- Compute the normalized histogram $p[k]$
  Note: $p[k]$ is the relative number of pixels with intensity k
- Histogram equalisation

$$J[i, j] = \sum_{k=0}^{I[i,j]} p[k]$$

Fin.



"F"?!
IT SEEMS TO ME THAT IF I'M NOT LEARNING THIS MATERIAL, YOU MUST NOT BE A VERY GOOD TEACHER!
